

Hatchery Assist Creating a Fish Id

Step 1 Fish Id Screen

 The screenshot shows the "Fish Id" window with several tabs: "Details", "Extra Info", and "Grade Info". The "Details" tab is active. The form contains the following fields and controls:

- Fish Id**: A text input field.
- Current Tank Id**: A text input field.
- Source Fish Id**: A text input field with a help icon (?) to its right.
- Create Date**: A date picker showing "10/03/2005".
- Growing for Customer**: A text input field with a help icon (?) to its right.
- Year Class**: A text input field with a help icon (?) to its right.
- Stock Outtake**: A text input field with the value "0".
- Morts**: A text input field with the value "0".
- Transfers Out**: A text input field with the value "0".
- Transfers In**: A text input field with the value "0".
- Stock Intake**: A text input field with the value "0".
- Less Sold**: A text input field with the value "0".
- Total Feed Consumed**: A text input field with the value "0".
- Adjustments**: A text input field with the value "0".
- Current Fish Count**: A text input field with the value "0".
- Fish Species**: A text input field with a help icon (?) to its right.
- Fish Type**: A dropdown menu with "(None)" selected.
- Total Strippings**: A text input field with the value "0".
- Status**: A dropdown menu with "(None)" selected.
- Status Date Changed**: A date picker showing "10/03/2005".
- Last Weight Check (gm)**: A text input field with the value "0.0000".
- Last Weight Date**: A text input field.
- Last Biomass kg**: A text input field with the value "0.00".

 At the bottom of the form, there are several buttons:

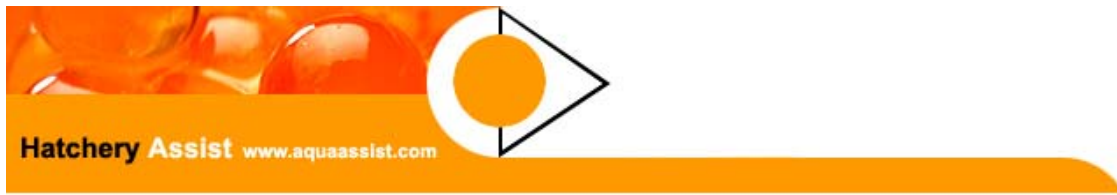

- Fish Healths**
- Fish to Tank Assignment**
- FCR Table Assignment**
- Strippings / Spawning**
- Fish Adjustments**
- Weight Calc Report**
- Navigation buttons**: A set of buttons including "k", "<", ">", and ">|".
- Action buttons**: "Save", "Find", "Delete", "Reset", "Print", "Refresh", "Cancel", "Help", and "Import".

Fish Id

The Fish Id field refers to a Batch identifier that allows you to quickly identify the origin and creation sequence of the fish.

i.e. A good fish ids naming convention is YEAR, BATCH NO. or CAGE NO.

For example: 0501 represents the year 2005 and 01 represents the first group of fish created, or can represent the Cage Id.

A Fish Id may be split, in which case the new id should have an extra letter or number added to the end. The id 0501 would then become 0501A and 0501B and so on. The original Fish Id would also be selected as the source Fish Id.

Create Date

This is the date that the fish are put together in a batch and the fish id is created on.

If the fish were created from a transfer, then the date of the first transfer should be used.

Year Class

This is used to group the different Fish Ids in the system by type of fish and year created.

For example: SALMON 2005 would be used as the Year Class for all salmon created in that year.

The Year Class must be entered by selecting the "?" box and choosing from the list. If there are no Year Classes, or a new one needs to be entered, selecting the "Add" button will allow these to be created. When creating these records the Item Type "FISH STOCK" must be chosen in order to see these records in the Year Class selection list.

Fish Species

This field allows to allocate the batch to a species ie Barramundi, Salmon, Trout etc

Fish Type

Fish Type is used to identify the sex of the batch
